

Cloud Rental Manager

302 PROPERTY

Mobile Application Documentation

Platform: Android & iOS (Flutter)

Version: 1.0.133

Type: Property Management

Overview

Cloud Rental Manager (302 Property) is a mobile application for managing rental properties end to end. It gives property managers and landlords a single place to track properties, owners, tenants, leases, rent payments, and maintenance, while giving staff, tenants, and vendors their own role-based access. The app is data-driven through a secure backend API and works on both Android and iOS.

User Roles

Admin / Property Manager

Full access — manages properties, owners, tenants, leasing, payments, maintenance, staff, communications, and reports.

Staff Member

Permission-based access to the modules an admin assigns (dashboard, rental, leasing, maintenance, reports, and more).

Tenant

Self-service portal to pay rent, view financials and documents, submit work orders, and manage their profile.

Vendor

Vendor portal to view assigned work orders, take part in the bid room, and update job status.

Main Features

Dashboard & Reports

Visual dashboard with revenue, rent past-due, expiring leases, and policy summaries shown as charts and tables. A reports section exports data to PDF and Excel.

Rental Management

Add and manage **properties** (with tax, insurance, utilities, and stats), **rental owners**, **tenants**, and **mortgages** assigned to properties.

Leasing

Handle **applicants**, **pending leases**, and the **rent roll** — recurring charges and payments, renewals, move-outs, evictions, notes, and documents.

Payments

Collect rent and fees with card validation and payment processing, plus scheduled and recurring charges and a record of past-due balances.

Maintenance & Work Orders

Create and track work orders, assign vendors, and let tenants raise maintenance requests from their portal.

Bid Room

Post jobs to a bid room where vendors submit competitive bids for maintenance work.

Communications Send emails to tenants and owners using reusable templates, and review a log of all sent messages.	Subscription Plans Built-in plan selection and purchase (including premium plans) so accounts can upgrade features within the app.
Profile & Settings Manage user profile, app settings, message templates, notifications, and contact/support.	

How It Works

- 1. Sign in.** Users log in (with sign-up, OTP, and password reset). The app detects the user's role and loads the matching experience.
- 2. Role-based home.** Each role lands on its own dashboard — admins and staff see management tools; tenants and vendors see their portals.
- 3. Work with live data.** All screens read from and write to a secure backend API, so properties, leases, payments, and work orders stay in sync across devices.
- 4. Take action.** Collect payments, send communications, manage maintenance and bids, and generate reports — with push notifications keeping everyone updated.

Technology

Framework	Flutter (Dart) — single codebase for Android & iOS
State management	Provider
Backend	REST API over HTTP with secure, token-based requests
Data & export	Charts (Syncfusion, fl_chart), PDF & Excel/CSV export
Payments	Credit-card validation and in-app payment processing
Other	Push notifications, file & image upload, e-signature, rich-text editor

This is a high-level functional overview of the main modules. For setup, build, and API details, see the developer notes in the project repository.
